Overview

Hormone Sensitive Lipase (HSL)

- Hormone-sensitive lipase is an enzyme expressed in multiple tissues. It plays number of roles in lipid metabolism.
- Major isoform of HSL gene is a single polypeptide with molecular mass of approximately 84kDa, its has 3 major domains catalytic, regulatory domain congaing several plosphorylation sites, and n-terminal domain involved in protein-protein and protein-lipid interactions.
- Alterered expression of HSL in different celltypes may be associated with several pathological states, including obesity, atherosclerosis, Type II Diabetes.
- HSL has lipolytic activity against not only triacylglycerol, but also against diacylglycerol, monoacylglycerol, and cholesteryl esters.
- Gene and protein structure of the HSL given below.

Gene: exon/intron organization of the human HSL gene. Exons T and A encode 300 and 43 additional amino acids respectively, located at the N-terminus.

Protein: Linear representation of the amino acid sequence of adipocyte HSL (numbering of the rat sequence).

Domains: N-terminal binding domain, a C-terminal catalytic domain, harbouring the catalytic triad and a regulatory module containing multiple phosphorylation sites. [Source](#)

- Fates of HSL products in different cell types.

Tissue	Major product	Function
Adipose tissue	Fatty acids	Export for oxidation
Muscle, heart	Fatty acids	Oxidation
Pancreatic β -cells	Fatty acids	Signalling?
Adrenals, testes, ovaries	Cholesterol	Substrate for steroidogenesis
Macrophages	Cholesterol	Export (via high-density lipoprotein)
Placenta, ovaries	Steroids	Transcriptional control
Mammary gland	Cholesterol	Milk component, membranogenesis

HSL, a drug target for Diabetes and Metabolic Disease

A few points suggesting HSL as a drug target for Type 2 Diabetes and Metabolic Disease:

- There are conflicting data on whether altered expression or activity of HSL is involved in familial combined hyperlipidaemia. Similar debate surrounds the role of altered levels of HSL in obesity and in insulin resistance, two linked conditions which predispose to Type II Diabetes. Source
- Elevated levels of plasma nonesterified fatty acids are associated with insulin resistance.
- A promoter variant of HSL, ?60C?G, has been implicated in a number of conditions, which exhibits a 40% decrease in promoter activity, has been associated with increased insulin sensitivity in women and decreased levels of plasma non-esterified fatty acid in men.
- Population studies suggest that a polymorphic marker in the HSL gene is in linkage disequilibrium with an allele that increases susceptibility to abdominal obesity, which is itself a risk factor for Type II diabetes. Source
- Over expression of HSL prevents lipid accumulation (from cell line studies). Source

Type 2 Diabetes

- Type 2 Diabetes Mellitus is a group of metabolic diseases characterized by high blood sugar (glucose) levels, which result from defects in insulin secretion, or insulin resistance, or both.
- Insulin, a hormone produced by the pancreas, which controls blood glucose levels.
- Insulin triggers glucose uptake by the cells. Some part of the glucose can be converted to concentrated energy sources like glycogen, triacylglycerols, or fatty acids.

Metabolic Disease

- A person with abnormal glucose tolerance (IGT or diabetes) will be found to have at least one or more of the other cardiovascular disease (CVD) risk components.
- This clustering has been labelled variously as Syndrome X, the Insulin Resistance Syndrome, the Metabolic Syndrome or Metabolic disease.

Non-patent Literature Search and Analysis

- In non-patent literature searching we got 17 records/articles. Out of these 8 articles are talking about chemical compounds that are involved in inhibition or stimulation of hormone-sensitive lipase (HSL) and 9 articles are scientific review papers.

Scientific papers on chemical compounds inhibiting or stimulating HSL

- Following is the distribution of the 8 articles based on Function of the compounds.
- Numbers in brackets indicate number of records in the concerned topic.
- Highlighted (in red color) numbers refer serial number in the [analysis table](#).

Distribution of non-patent articles

- Detailed analysis of the above records is available at the following link: [Analysis Table](#)

the

General scientific studies on HSL found from STN

- Off the 17 articles, 9 articles are talking about variations in the HSL gene and review papers. Variations discussed are C-60G polymorphism in the promoter of the HSL gene and a dinucleotide repeat in the gene, which are associated with Type 2 diabetes, suggesting the putative role of the HSL in Type 2 diabetes. Other articles are reviews saying HSL is a potential target for treating or curing Type 2 diabetes.
- The following hyperlink takes us to the above mentioned 9 articles: [Scientific studies of HSL](#)

Patentability Search

Sequence Search and Analysis

- Sequence search on NCBI.
 - ◆ Got 16 relevant patents.
 - ◆ [Spread sheet](#)
- Sequence search on DGENE.
 - ◆ Got 42 relevant patents.
 - ◆ [Spread sheet](#)
- Sequence search on PCTGEN.
 - ◆ Got 16 relevant patents.
 - ◆ [Spread sheet](#)

Sequence Search Strategy

S.No.	Database	Sequence Query	Key Words (to restrict unrelated patents)	Hits
1	NCBI (Blast)	• HSL protein		13
2	NCBI (Blast)	• HSL mRNA		19
3	DGENE (Blast search)	• HSL protein • HSL mRNA	• diabetes • NIDDM • IDDM • T2DM	61
4	PCTGEN (Blast search)	• HSL protein • HSL mRNA		83
<ul style="list-style-type: none"> • In NCBI got 16 relevant patents. • In DGENE got 42 relevant patents. • In PCTGEN got 16 relevant patents.

Micropatent Search and Analysis

- The following is the link to search strategy on Micropat [Search on micropat](#)
- The following provides an example of how patents were analyzed [Sample patent analysis](#)
- From Micropat search, 769 patents were analyzed out of which 41 are on target.

Final Patent list (with bibliographic information)

- After removing duplicates and family members of relevant patents found from NCBI, PCT Gene, DGENE and Micropat, we got 96 relevant patents.
- [Final list of patents](#)

Overall IP activity

- The below graph indicates the overall patenting trend for the 96 relevant patents over time

Overall IP Activity

Key Players (those with more than 2 patents)

- Key players in the field (total 66 records) are Novo Nordisk, Sanofi Aventis, Incyte, Curagen, Hyseq, Alizyme Therapeutics, Genentech, Human Genome Sciences, Takeda, Alteon, Bristol-Myers Squibb, Eli Lilly, Genset, ISIS Pharmaceuticals, Japan Tobacco, Novartis.

Key Players

Other players (those with 1 patent)

- In all, other players have 30 patents to their name.
