# Palliative care

To go back to the previous page, click here

Palliative care for advanced stage prostate cancer focuses on extending life and relieving the symptoms of metastatic disease. Bone pain due to metastatic disease is treated with opioid pain relievers such as morphine and oxycodone. External beam radiation therapy directed at bone metastases may provide pain relief. Injections of certain radioisotopes, such as strontium-89, phosphorus-32, or samarium-153, also target bone metastases and may help relieve pain.
