Phospholipids and Sphingolipids of Milk

Contents

Objective

To create a technology landscape report on **Phospholipids and Sphingolipids of Milk**<

◊ Identify market players with prolific IP activity in the technology area
◊ Segment the players by the industry they belong to

Note: *This report is just a template and gives an indication of what the paid report contains.*

MFGM_Str
MFGM: Milk fat globule membrane (MFGM) is a protein-lipid biopolymer that originates from the apical surface of mammary epithelial cells and surrounds fat globules in milk. While MFGM is in all dairy products containing milk fat, it is especially enriched in churn **buttermilk**, a co-product of butter production. The phospholipids and membrane glycoproteins found in MFGM likely interact extensively with the gut epithelia during digestion, both physically and biochemically. Moreover, MFGM has a relatively high concentration of sphingolipids, which in purified form have been demonstrated to be protective against colon cancer.Hintze et al

Phospholipids and sphingolipids fall under the category of **polar lipids**. The polar lipid content of raw milk is reported to range between **9.4 and 35.5 mg per 100 g** of milk Rombaut and Dewettinck. The major phospholipid fractions are phosphatidylethanolamine**(PE)** and phosphatidylcholine**(PC)** followed by smaller amounts of Phosphatidylserine**(PS)** and phosphatidylinositol**(PI)**. The major sphingolipid fraction is **sphingomyelin** with smaller portions of **ceramides** and **gangliosides**. These polar lipids are mainly(~60%) located in the milk fat globule membrane **(MFGM)**,rest are located in skim milk phase.Lars Wiking
The phospholipids and sphingolipids in milk are gaining interest due to their nutritional and technological qualities. Sphingolipids and their derivatives are highly bioactive compounds with anti-cancer, bacteriostatic and cholesterol-lowering properties.Rombaut and Dewettinck

Nutritional Aspects/ Biological Effects of Some Polar Lipids of MFGM				
MFGM Component	**Sphingolipids and Metabolites**	**Phosphatidylserine (PS)**	**Phosphatidylcholine (PC)**	**Lyso-Phosphatidylcholine (lyso PC)**
Nutritonal	1) Reduction in the number of aberrant crypt foci(clusters of abnormal tube-like glands in the lining of the colon and rectum) and adenocarcinomas(Epithelium Cancer).	1) Restore normal memory on a variety of tasks.	1) Reduction of necrotising enterocolitis	1) Bacteriostatic and bactericidal capacity

	2) Shift in tumor type (malignant ? benign)	2) Positive effects on alzheimer patients.	2) Support liver recovery from toxic chemical attack or viral damage
	3) Anti-cholesterolemic.	3) Improve exercise capacity of exercising humans	3) Protects the human GI mucosa against toxic attack
	4) Protection of the liver from fat- and cholesterol-induced steatosis(abnormal retention of lipids within a cell).		
	5) Suppression of gastrointestinal pathogens.		
	6) Neonatal gut maturation.		
	7) Myelination of the developing central nervous system.		
	8) Associated with age-related diseases and the development of Alzheimer.		

Mohamed Mansour El-Loly

Phospholipids

Phospholipids are fat derivatives in which one fatty acid has been replaced by a **phosphate group** (PO_4^-) and one of several nitrogen-containing molecules. These play a major role in milk due to their **amphiphilic** properties, i.e. they contain both hydrophobic tail(hydrocarbon chain) and hydrophilic head regions. Phospholipids represent a major portion of total lipids of buttermilk and skim milk, reflecting presence of proportionately larger amounts of membrane materials in these products Fox and McSweeney(Pg 71). **MGFM** phospholipids contain high levels of **palmitic** and **oleic** acid, while the short and medium-chain fatty acids are present in very low levels. Lars Wiking
Dairy phospholipids are important structurally, because they are able to:

- stabilize emulsions and foams,
- form micelles and membranes.

Phospholipids also have the potential to be **pro-oxidants**, because they contain **mono-unsaturated** and **poly-unsaturated** fatty acids and have the ability to attract metal ions. **Phosphatidyl ethanolamine** binds copper strongly and is believed to be important in **copper induced oxidation** in milk Fox and McSweeney(Pg 580). The polyunsaturated fatty acids and metal ions accelerate lipid oxidation, especially when heat is applied; hence, phospholipids can be degraded during the processing of milk. Fox and McSweeney(Pg 20)

Sphingolipids

Sphingolipids are composed of a **ceramide core**, which in turn, is composed of a **sphingosine**(12-22 C-atoms) backbone with a fatty acid covalently bonded via an **amide linkage**. Several different head groups may be covalently attached to the ceramide, each resulting in a different class of sphingolipid. **Examples** include **sphingomyelin**, with a phosphocholine headgroup, **glycosphingolipids** with one or more monosaccharides in the headgroup and **gangliosides**, which have at least three sugars in head group including at least one sialic acid. Like phospholipids, sphingolipids are also amphiphilic in nature. Hintze et al

Sphingolipids and their derivatives are **highly bioactive** compounds with **anti-cancer**, **bacteriostatic** and **cholesterol-lowering** properties. Rombaut and Dewettinck One significant source of dietary sphingolipids is the milk fat globule membrane **(MFGM)** Hintze et al. Milk contains (per L) 39?119 mg of sphingomyelin, 6?11 mg of glucosylceramide, 6.5?15 mg of lactosylceramide and ~11 mg of gangliosides. Rombaut and Dewettinck

1	WO2011069987A1	6/16/2011	NESTEC S.A.	Infant Formula With Probiotics And Milk Fat Globule Membrane Components	Formulation of infant feed (or nutritional product for patients in need) including probiotics and MFGM components along with other nutrient ingredients for improvising immune system and gut comfort. The MFGM components are recovered by ultrafiltration or microfiltration recovered buttermilk, or from whey protein concentrate, sweet whey, acid whey, whey cream, etc.
2	EP2308324A1	4/13/2011	Arla Foods amba	Phosphatidylserine Enriched Milk Fractions For The Formulation Of Functional Foods	Extraction of Phophatidylserine from natural source i.e. bovine buttermilk, butter oil serum, etc., following steps of centrifugation of cream, homogenizing to break resulting emuslion, collection of serum phase, and separation of fat by ultrafiltration including dialfiltration and finally spray drying. This composition can be used as nutraceutical composition in foods.
